

OWM JAPIs

Java APIs for OpenWeatherMap.org

Create weather-aware applications for **Java and Android platforms** in minimum time using this easy-to-use, detailed and documented API library for retrieving weather data from OpenWeatherMap.org.

OWM JAPIs lets you **get weather data in just 3-5 lines of code** (excluding any other/skeleton code, of course). You can develop applications for multiple platforms using this library, such as Windows, Mac OS X and Linux (by creating Java applications), and Android.

Why to use OWM JAPIs?

1. Free
2. Easy to use
3. Minimizes your code

OWM JAPIs lets you **focus only on your application code** and weather retrieval code is already there. Additionally, weather retrieval code becomes short and simple using this library – as less as 3-5 lines of code can get you weather data from OpenWeatherMap.org in your Java or Android application. **Don't believe? Have a look on the example below.**

Downloads

Download the library's source and binaries from [OWM JAPIs Downloads](#).

Versions

2.5 (Compatible with OpenWeatherMap.org's API v2.5)

2.5.0.2 (latest)

Bug-fix version:

1. Fixed bugs which caused wrong parsing of date and time.
2. Improved code formatting and readability (for developers).

2.5.0.1

Implemented:

1. Current Weather
2. Weather Forecasts
3. Daily Forecasts
4. Wind degree to direction converter

Not implemented but planned:

1. Searching of City
2. Weather Maps
3. Country code to name converter
4. Direction code to name converter

How to use OWM JAPIs?

Anyone with little coding knowledge of Java will feel at home while using this library. **Identifiers are written to be self-explanatory and APIs' documentation** is also provided. It makes the coding process very easy, even for beginners.

1. Add these two JAR files in your project's libraries:
 1. OWM_JAPIs.jar
 2. JSON.jar
2. Write your code as such:
 1. Create and initialize object {obj1} of "OpenWeatherMap" class
 2. Call this object's {obj1} functions to get the desired weather data (such as current weather, weather forecast, etc.).
 3. The data is returned as a new object {obj2} of a compatible class based on the type of asked weather data (current weather data comes in a different class's object than weather forecast data).
 4. Call this returned object's {obj2} functions to get the required information from the collective weather data (such as temperature, pressure, wind speed, etc.).

Kindly have a look on the example below for a clear understanding.

Example

Basic Example

Source Code

```
import java.io.IOException;
import java.net.MalformedURLException;
import net.aksingh.java.api.owm.CurrentWeatherData;
import net.aksingh.java.api.owm.OpenWeatherMap;
import org.json.JSONException;

public class OwmJapisExample1 {

    public static void main(String[] args)
        throws IOException, MalformedURLException, JSONException {

        // declaring object of "OpenWeatherMap" class
        OpenWeatherMap owm = new OpenWeatherMap("");

        // getting current weather data for the "London" city
        CurrentWeatherData cwd = owm.currentWeatherByCityName("London");

        //printing city name from the retrieved data
        System.out.println("City: " + cwd.getCityName());

        // printing the max./min. temperature
        System.out.println("Temperature: " + cwd.getMainData_Object().getMaxTemperature()
            + "/" + cwd.getMainData_Object().getMinTemperature()
            + "\'F");
    }
}
```

Output

```
City: London
Temperature: 73.4/68.72 'F
```

Advance Example

You can simply use the APIs (as given in basic example) for learning, testing or experimenting with the functions provided in this library. But it's not good enough for a production or enterprise environment.

Professionally, you should always **write code which can handle errors/exceptions** at the runtime. OWM JAPIs solves this problem too – by providing checker functions which allows you to **check if a data is available or not**, i.e., that particular data is retrieved and parsed properly or not. Of course, exception handling can still be used, but these functions are really useful and make the data-error-handling task very simple.

Using OWM JAPIs, you can always check if a particular data is available or not. This is done by using the **has<data-name>()** functions. For example, **hasResponseCode()** function checks if the retrieved data has a response code or not; and if available, response code can be used to check if the whole data was downloaded and parsed correctly or not, as shown below in the example.

Source Code

```
import java.io.IOException;
import java.net.MalformedURLException;
import net.aksingh.java.api.owm.CurrentWeatherData;
import net.aksingh.java.api.owm.OpenWeatherMap;
import org.json.JSONException;

public class OwmJapisTest {

    public static void main(String[] args)
        throws IOException, MalformedURLException, JSONException {

        // declaring object of "OpenWeatherMap" class
        OpenWeatherMap owm = new OpenWeatherMap("");

        // getting current weather data for the "London" city
        CurrentWeatherData cwd = owm.currentWeatherByCityName("London");

        // checking data retrieval was successful or not using the response code
        // response code = 200 means successful retrieval
        if (cwd.hasResponseCode() && cwd.getResponseCode() == 200) {

            // checking if city name is available
            if (cwd.hasCityName()) {
                //printing city name from the retrieved data
                System.out.println("City: " + cwd.getCityName());
            }

            // checking if max. temp. and min. temp. is available
            if (cwd.getMainData_Object().hasMaxTemperature() && cwd.getMainData_Object().hasMinTemperature()) {
                // printing the max./min. temperature
                System.out.println("Temperature: " + cwd.getMainData_Object().getMaxTemperature()
                    + "/" + cwd.getMainData_Object().getMinTemperature() + "'F");
            }
        }
    }
}
```

```
}  
  }  
}
```

Output

```
City: London  
Temperature: 73.4/68.72 'F
```

Bugs / Requests

Got a problem, error or bug in the library? Or want a new feature that's not present in OWM JAPIs?

Kindly post bugs or feature requests at [OWM JAPIs Bugs/Requests](#) and I will try to solve/add it in the next release.
